Application of First Order Polynomial Differential Equation for Generating Analytical Solutions to the Three-Dimensional Incompressible Navier-Stokes Equations

Gunawan Nugroho

Department of Engineering Physics, Institut Teknologi Sepuluh Nopember, Jl. Arief Rahman Hakim, Sukolilo, Surabaya, Indonesia (60111)

Abstract. The three-dimensional incompressible Navier-Stokes equations are solved in this work with the application of the transformed coordinate which defines as a set of functionals, $h_i(\xi) = k_i x + l_i y + m_i z - c_i t$. The solution is proposed from the base of higher order polynomial first order differential equation, which is firstly reduced into the Riccati equation. The Riccati equation is then implemented into the Navier-Stokes equations to produce the polynomial equation with variable coefficients. The resultant solutions from the system of Riccati and polynomial are then evaluated by the proposed method of integral evaluation. The existence property is analysed and uniqueness of velocities is ensured. It is found that the pressure is not unique.

2010 Mathematics Subject Classifications: 35A09, 35C05, 76D05

Key Words and Phrases: Continuity equation, the Navier-Stokes equations, analytical solutions, partial differential equations, integral evaluation

1. Introduction

The problem of searching for the classes of analytical solutions of the full Navier-Stokes equations is highly demanding from both theoretical and practical viewpoints, as has been described in the literature [11]. The main difficulty of analytical solution of the Navier-Stokes equations is the contribution of the nonlinear terms representing fluid inertia which then troubled the conventional analysis in general cases. However, there are some works have already been conducted in the literatures [15, 16, 12]. As in the most cases, analytical solutions are examined only in special conditions in which the nonlinearity are weakened or even removed from the analysis.

There are also sophisticated analysis of the Navier-Stokes equations which have been conducted and the results gives more insight to the problems [2]. One of them is the transformation of the Navier-Stokes equations to the Schrödinger equation, performed by application of...
the Riccati equation [1]. It has good prospects since the Schrödinger equation is linear and has well defined solutions. The reduction of the full set of Navier-Stokes equations to be a class of nonlinear ordinary differential equation is also performed [7]. The solution applied to both zero and constant pressure gradient cases. The method of introducing special solutions for velocity has also been investigated in [14, 13].

In this work, we discuss the continuity and three-dimensional incompressible Navier-Stokes equations with forcing functions

\[ u_x + v_y + w_z = 0, \tag{1a} \]
\[ u_t + uu_x + vv_y + wu_z = -\frac{1}{\rho}p_x + uu_{xx} + vv_{yy} + wu_{zz} + F_1, \tag{1b} \]
\[ v_t + uv_x + vv_y + wv_z = -\frac{1}{\rho}p_y + vv_{xx} + vv_{yy} + vv_{zz} + F_2, \tag{1c} \]
\[ w_t + uw_x + vw_y + ww_z = -\frac{1}{\rho}p_z + uu_{xx} + vv_{yy} + uu_{zz} + F_3, \tag{1d} \]

The following relation is produced from the continuity equation (1a),

\[ u = -\int_x \left( v_y + w_z \right) dx + K_1 (y, z, t). \tag{2} \]

Equation (2) can be substituted into (1d) to give

\[ w_t + \left[ -\int_x \left( v_y + w_z \right) dx + K_1 \right] w_x + vw_y + ww_z = -\frac{1}{\rho}p_z + uv \left( w_{xx} + w_{yy} + w_{zz} \right) + F_3. \tag{3} \]

Then the pressure relation can be determined as

\[ p = \rho \int_z \left\{ F_3 + uv \left( w_{xx} + w_{yy} + w_{zz} \right) + w_x \left[ \int_x \left( v_y + w_z \right) dx - K_1 \right] - w_t - vw_y - ww_z \right\} dz \]
\[ + K_2 (x, y, t). \tag{4} \]

The next step is implementing equation (2) and (4) into (1c),

\[ v_x \int_x \left( v_y + w_z \right) dx - K_1 v_x = v_t + vv_y + vw_z - \left( v_{xx} + v_{yy} + v_{zz} \right) + K_2 y \]
\[ + \frac{\partial}{\partial y} \left[ \int_z \left\{ F_3 + uv \left( w_{xx} + w_{yy} + w_{zz} \right) + w_x \left[ \int_x \left( v_y + w_z \right) dx - K_1 \right] - w_t - vw_y - ww_z \right\} dz \right]. \tag{5} \]

Suppose that the coordinate also satisfy the following set of traveling wave ansatz

\[ h_i (\xi) = k_i x + l_i y + m_i z - c_i t, \tag{6} \]

where \( k_i, l_i, m_i \) and \( c_i \) are constants. The step is now transforming the cartesian coordinate into \( \xi \)-coordinate by setting the subscript \( i = 1, 2, 3, 4 \) such that we have four equations for the coordinate transformation. The results of \( x = \psi_1 (\xi), y = \psi_2 (\xi), z = \psi_3 (\xi) \) and \( t = \psi_4 (\xi) \) are then determined.
2. Methodology

Applying one of the traveling wave ansatzs, i.e. \( h_1(\xi) = k_1 x + l_1 y + m_1 z - c_1 t \) into (5), the considered equation then transformed into

\[
\frac{k_1}{h_1^\xi} v_\xi (k l v + k m w) + \frac{k_1}{h_1^\xi} K_1 v_\xi = -\frac{c_1}{h_1^\xi} v_\xi + \frac{l_1}{h_1^\xi} v v_\xi + \frac{m_1}{h_1^\xi} w v_\xi
\]

\[
-\nu \left( \frac{k_1^2}{h_1^\xi} + \frac{l_1^2}{h_1^\xi} + \frac{m_1^2}{h_1^\xi} \right) v_\xi + \frac{l_1}{m_1} F_3 + F_2 + \frac{l_1}{h_1^\xi} K_{2\xi} + \nu \left( \frac{k_1^2 l_1}{h_1^\xi m_1} + \frac{l_1^3}{h_1^\xi m_1} + \frac{l_1 m_1^2}{h_1^\xi m_1} \right) w_\xi
\]

\[
+ \frac{k_1}{h_1^\xi} F_3 \left[ \left( \frac{k_1 l_1^2}{m_1} v + k l_1 w \right) - K_1 \right] + \frac{c_1 l_1}{h_1^\xi m_1} w_\xi - \frac{l_1^2}{h_1^\xi m_1} v w_\xi - \frac{l_1}{h_1^\xi} w w_\xi.
\]  

(7)

Rearranging (7) to give

\[
a_1 v_\xi + a_2 v v_\xi + (a_3 + a_4 w) v_\xi + a_5 w v_\xi = a_6 w_\xi + a_7 w_\xi + a_8 w w_\xi + \frac{l_1}{m_1} F_3 + F_2 + \frac{l_1}{h_1^\xi} K_{2\xi},
\]  

(8)

where \( a_i \) are variables that depend on \( \xi \).

The previous work shows that equation (8) is transformable into the system of Riccati and polynomial equations with variable coefficients. In this work, we generalize the method to the class of polynomial differential equations as in the following

\[
v_\xi = a_1 v^n + a_2 v^{n-1} + a_3 v^{n-2} + a_4 v^{n-3} + a_5 v^{n-4} + \cdots + a_{n-1} v^2 + a_n v + a_{n+1}.
\]  

(9)

The equation is also transformable into the Riccati equation as formulated in the following statement.

**Theorem 1.** Given \( q \) is a function resulted from the factorization of equation (9). Set \( v = -u \) then the explicit expression for \( a_{n+1} \) can be determined as a function of higher order polynomial coefficients such that equation (9) is transformable into the Riccati equation as

\[
v_\xi = q v^2 + a_n v + a_{n+1}.
\]

**Proof.** (By induction) Consider the following equation

\[
v_\xi = a_1 v^7 + a_2 v^6 + a_3 v^5 + a_4 v^4 + a_5 v^3 + a_6 v^2 + a_7 v + a_8.
\]  

(10)

The above equation can be rewritten as

\[
v_\xi = [v + u] \left[ a_1 v^6 + (a_2 - a_1 u) v^5 + (a_3 - a_2 u + a_1 u^2) v^4 + K_3 v^3 + K_4 v^2 \right]
\]

\[
+ \left( a_6 - a_5 u + a_4 u^2 - a_3 u^3 - a_2 u^4 + a_1 u^5 \right) v^2 + a_7 v + a_8 = 0,
\]

(11)

where \( K_3 = a_4 - a_3 + a_2 u^2 + a_1 u^3 \) and \( K_4 = a_5 - a_4 u + a_3 u^2 - a_2 u^3 + a_1 u^4 \). Set \( v = -u \) and \( a_6 - a_5 u + a_4 u^2 - a_3 u^3 - a_2 u^4 + a_1 u^5 = q \) to give the system of

\[
a_6 - a_5 u + a_4 u^2 - a_3 u^3 - a_2 u^4 + a_1 u^5 = q \text{ and } u_\xi = -q u^2 + a_7 u - a_8.
\]
Lemma 1. The first equation of (12) is reducible to the fourth order equation.

Proof. The first equation of (12) can be rewritten as

\[
\frac{a_6}{a_1} - \frac{a_5}{a_1} u + \frac{a_4}{a_1} u^2 - \frac{a_3}{a_1} u^3 + \frac{a_2}{a_1} u^4 - u^5 = \frac{q}{a_1}.
\]  

(12)

Set \( u = z + A \) to give

\[
(z + A)^5 - \frac{a_2}{a_1} (z + A)^4 + \frac{a_3}{a_1} (z + A)^3 - \frac{a_4}{a_1} (z + A)^2 + \frac{a_5}{a_1} (z + A) + \frac{q - a_6}{a_1} = 0.
\]  

(13)

The above expression can be expanded as follows

\[
(z^5 + 5A z^4 + 10A^2 z^3 + 10A^3 z^2 + 5A^4 z + A^5) - \frac{a_2}{a_1} (z^4 + 4Az^3 + 6A^2 z^2 + 4A^3 z + A^4)
\]

\[
+ \frac{a_3}{a_1} (z^3 + 3Az^2 + 3A^2 z + A^3) - \frac{a_4}{a_1} (z^2 + 2Az + A^2) + \frac{a_5}{a_1} (z + A) + \frac{q - a_6}{a_1} = 0,
\]  

(14)

\[
z^5 + \left(5A - \frac{a_2}{a_1}\right) z^4 + \left(\frac{10A^2 - 4A a_2}{a_1} + \frac{a_3}{a_1}\right) z^3 + \left(\frac{10A^3 - 6A^2 a_2}{a_1} + \frac{3A a_3}{a_1} - \frac{a_4}{a_1}\right) z^2
\]

\[
+ \left(5A^4 - 4A^3 a_2 + 3A^2 a_3 - 2A^2 a_4 + a_5\right) z
\]  

\[
+ \left(A^5 - \frac{a_2}{a_1} A^4 + \frac{a_3}{a_1} A^3 - \frac{a_4}{a_1} A^2 + \frac{a_5}{a_1} A + \frac{q - a_6}{a_1}\right) = 0.
\]  

(15)

By using the equation \((z + b)(z + c)(z + d)(z + e)(z + f) = 0\) as

\[
z^5 + (b + c + d + e + f) z^4 + (bf + cf + df + ef + be + ce + de + db + dc + bc) z^3
\]

\[
+ (bef + cef + def + dbf + dcf + bc + dbe + dce + bce) z^2
\]

\[
+ (dbef + dcef + bcf + bcdef) z + bcdef = 0
\]  

(16)

with

\[
b + c + d + e + f = 5A - \frac{a_2}{a_1},
\]

\[
bf + cf + df + ef + be + ce + de + db + dc + bc = 10A^2 - 4A a_2 + \frac{a_3}{a_1},
\]

\[
bef + cef + def + dbf + dcf + bcf + dbe + dce + bce = 10A^3 - 6A^2 a_2 + 3A a_3 - a_4,
\]

\[
dbef + dcef + bcf + bcde = 5A^4 - 4A^3 a_2 + 3A^2 a_3 - 2A a_4 + a_5,
\]

\[
bcdef = A^5 - \frac{a_2}{a_1} A^4 + \frac{a_3}{a_1} A^3 - \frac{a_4}{a_1} A^2 + \frac{a_5}{a_1} A + \frac{q - a_6}{a_1}.
\]
Evaluating the coefficients in (15) and (16),
\[
bf + cf + df + ef + be + ce + de + db + dc + bc =
10A^2 - 4A^2 \frac{a_2}{a_1} + \frac{a_3}{a_1} \left( 5A - \frac{a_2}{a_1} - f \right) f + be + ce + de + db + dc + bc = 10A^2 - 4A^2 \frac{a_2}{a_1} + \frac{a_3}{a_1}
\]
or
\[
\left( 5A - \frac{a_2}{a_1} \right) f - f^2 + be + ce + de + db + dc + bc = 10A^2 - 4A^2 \frac{a_2}{a_1} + \frac{a_3}{a_1} \quad (17)
\]
\[
be f + cef + def + dbf + dcf + bcf + dbe + dce + bce = 10A^3 - 6A^2 \frac{a_2}{a_1} + 3A^2 \frac{a_3}{a_1} - \frac{a_4}{a_1}
\]
\[
\left( f^2 - \left( 5A - \frac{a_2}{a_1} \right) f + 10A^2 - 4A^2 \frac{a_2}{a_1} + \frac{a_3}{a_1} \right) f + dbe + dce + bce
= 10A^3 - 6A^2 \frac{a_2}{a_1} + 3A^2 \frac{a_3}{a_1} - \frac{a_4}{a_1},
\]
\[
of^3 - \left( 5A - \frac{a_2}{a_1} \right) f^2 + \left( 10A^2 - 4A^2 \frac{a_2}{a_1} + \frac{a_3}{a_1} \right) f + dbe + dce + bce
\]
\[
= 10A^3 - 6A^2 \frac{a_2}{a_1} + 3A^2 \frac{a_3}{a_1} - \frac{a_4}{a_1} f^3 - \left( 5A - \frac{a_2}{a_1} \right) f^2 + \left( 10A^2 - 4A^2 \frac{a_2}{a_1} + \frac{a_3}{a_1} \right) f
\quad (18)
\]
\[
\quad + dbe + dce + bce = 10A^3 - 6A^2 \frac{a_2}{a_1} + 3A^2 \frac{a_3}{a_1} - \frac{a_4}{a_1},
\]
dbef + dcef + bcef + bcde = 5A^4 - 4A^3 \frac{a_2}{a_1} + 3A^2 \frac{a_3}{a_1} - 2A \frac{a_4}{a_1} + \frac{a_5}{a_1},
\]
\[
\left( -f^3 + \left( 5A - \frac{a_2}{a_1} \right) f^2 - \left( 10A^2 - 4A^2 \frac{a_2}{a_1} + \frac{a_3}{a_1} \right) f + 10A^3 - 6A^2 \frac{a_2}{a_1} + 3A^2 \frac{a_3}{a_1} - \frac{a_4}{a_1} \right) f
\]
\[
+ bcde = 5A^4 - 4A^3 \frac{a_2}{a_1} + 3A^2 \frac{a_3}{a_1} - 2A \frac{a_4}{a_1} + \frac{a_5}{a_1},
\]
or
\[
-f^4 + \left( 5A - \frac{a_2}{a_1} \right) f^3 - \left( 10A^2 - 4A^2 \frac{a_2}{a_1} + \frac{a_3}{a_1} \right) f^2 + \left( 10A^3 - 6A^2 \frac{a_2}{a_1} + 3A^2 \frac{a_3}{a_1} - \frac{a_4}{a_1} \right) f
\quad (19)
\]
\[
+ bcde = 5A^4 - 4A^3 \frac{a_2}{a_1} + 3A^2 \frac{a_3}{a_1} - 2A \frac{a_4}{a_1} + \frac{a_5}{a_1},
\]
\[
bcdef = A^5 - \frac{a_2}{a_1} A^4 + \frac{a_3}{a_1} A^3 - \frac{a_4}{a_1} A^2 + \frac{a_5}{a_1} A + \frac{q - a_6}{a_1},
\]
\[
\left( f^4 - \left( 5A - \frac{a_2}{a_1} \right) f^3 + K_5 f^2 - K_6 f + 5A^4 - 4A^3 \frac{a_2}{a_1} + 3A^2 \frac{a_3}{a_1} - 2A \frac{a_4}{a_1} + \frac{a_5}{a_1} \right) f
\]
\[
= A^5 - \frac{a_2}{a_1} A^4 + \frac{a_3}{a_1} A^3 - \frac{a_4}{a_1} A^2 + \frac{a_5}{a_1} A + \frac{q - a_6}{a_1},
\]
where \( K_5 = 10A^2 - 4A{a_2 \over a_1} + {a_3 \over a_1} \) and \( K_6 = 10A^3 - 6A^2 {a_2 \over a_1} + 3A {a_3 \over a_1} - {a_4 \over a_1} \). The above equation can be rewritten as

\[
f^5 - \left(5A - {a_2 \over a_1}\right)f^4 + \left(10A^2 - 4A{a_2 \over a_1} + {a_3 \over a_1}\right)f^3 - \left(10A^3 - 6A^2 {a_2 \over a_1} + 3A {a_3 \over a_1} - {a_4 \over a_1}\right)f^2
\]

\[
+ \left(5A^4 - 4A^3{a_2 \over a_1} + 3A^2{a_3 \over a_1} - 2A{a_4 \over a_1} + {a_5 \over a_1}\right)f = A^5 - {a_2 \over a_1}A^4 + {a_3 \over a_1}A^3 - {a_4 \over a_1}A^2 + {a_5 \over a_1}A
\] (20)

It follows that

\[
\left[f^5 - 5Af^4 + 10A^2f^3 - 10A^3f^2 + 5A^4f - A^5\right] + \frac{a_2}{a_1}f^4 + \left(a_3 + 4A\right)f^3
\]

\[
+ \left(6A^2 - 3A{a_3 \over a_1} + {a_4 \over a_1}\right)f^2 + \left(3A^2{a_3 \over a_1} - 2A^2{a_4 \over a_1} + {a_5 \over a_1}\right)f
\]

\[
+ \left(A^4 - {a_3 \over a_1}A^3 + {a_4 \over a_1}A^2 - {a_2 \over a_1}A + {a_6 - q \over a_2}\right) = 0.
\] (21)

Set \( f^5 - 5Af^4 + 10A^2f^3 - 10A^3f^2 + 5A^4f - A^5 = 0 \), and \( f = g^nA \) to obtain

\[
\left(g^{5n} - 5g^{4n} + 10g^{3n} - 10g^{2n} + 5g^n - 1\right)A^5 = 0
\]

or

\[
g^{5n} - 5g^{4n} + 10g^{3n} - 10g^{2n} + 5g^n - 1 = 0,
\] (22)

where \( n \) is an arbitrary constant. Note that equation (22) is a polynomial equation with constant coefficients which the solutions are definable by the existing computer programs. Also, the coefficient \( a_1 \) can be recovered by the definition of \( q \) as will be explained later. Thus, equation (21) is reduced into,

\[
f^4 + \left(a_3 - 4A\right)f^3 + \left(6A^2 - 3A{a_3 \over a_2} + {a_4 \over a_2}\right)f^2 + \left(3A^2{a_3 \over a_2} - 2A{a_4 \over a_2} + {a_5 \over a_2} - 4A^3\right)f
\]

\[
+ \left(A^4 - {a_3 \over a_2}A^3 + {a_4 \over a_2}A^2 - {a_2 \over a_2}A + {a_6 - q \over a_2}\right) = 0.
\] (23)

This proves lemma 1.

Substituting for \( f = g^nA \), then the fourth order polynomial equation is produced which can be solved by radical solution. Therefore, take the root of \( A = \alpha (\xi) \), meanwhile, \( v = -u \), \( v = z + A, z = -f \) and \( f = g^nA \), the solution for \( u \) will become

\[
v = -u = -z - A = f - A = (g^n - 1)A = (g^n - 1)\alpha.
\] (24)

**Lemma 2.** Consider the second equation of (12). There exists a function \( \beta \) such that \( a_8 = \beta u \), which generate the Bernoulli equation. The equation then has closed-form exact solutions when \( \beta \) is solvable.
Proof. Setting $a_8 = \beta u$, the original problem is transformed into
\[
    u_\xi = -qu^2 + (a_7 - \beta) u. \tag{25}
\]
The solution of (25) is expressed as
\[
    u = \frac{a_8}{\beta} = \frac{e^{\int_\xi (a_7 - \beta) d\xi}}{\int_\xi q e^{\int_\xi (a_7 - \beta) d\xi} d\xi} \tag{26}
\]
Let $\int_\xi q e^{\int_\xi (a_7 - \beta) d\xi} d\xi = D$, then $e^{\int_\xi (a_7 - \beta) d\xi} = \frac{1}{q} D_\xi$. Solving for $D$,
\[
    D = \int_\xi q e^{\int_\xi (a_7 - \beta) d\xi} d\xi = \int_\xi q e^{\int_\xi (a_7 - \beta) d\xi} d\xi = e^{\int_\xi \frac{q_0}{\beta} d\xi}. \tag{27}
\]
Set $\beta = \frac{\alpha}{B}$ and differentiate (27) once to give
\[
    A e^{\int_\xi (a_7 - \frac{\alpha}{B}) d\xi} = a_8 B e^{\int_\xi \frac{q_0}{\alpha} d\xi} = g. \tag{28}
\]
Thus, $A$ and $B$ are given by
\[
    A = -\frac{g e^{-\int_\xi a_7 d\xi}}{\int_\xi \frac{g}{B} e^{-\int_\xi a_7 d\xi} d\xi} \text{ and } B = \frac{g}{a_8 \int_\xi \frac{q_0}{\alpha} d\xi}. \tag{29}
\]
The function $\alpha$ can be determined as
\[
    \beta = \frac{A}{B} = -\frac{a_8 e^{-\int_\xi a_7 d\xi}}{\int_\xi \frac{g}{B} e^{-\int_\xi a_7 d\xi} d\xi}. \tag{30}
\]
Without loss of generality suppose that, $g e^{-\int_\xi a_7 d\xi} = A$ to produce
\[
    \frac{A}{B} = -\frac{a_8 e^{-\int_\xi a_7 d\xi} \int_\xi q e^{\int_\xi a_7 d\xi} d\xi}{\int_\xi \frac{2A}{B} d\xi}. \tag{31}
\]
The solution for $\beta$ is then
\[
    \beta = \frac{A}{B} = \left\{ \left[ C_1 \int_\xi \left( a_8 e^{-\int_\xi a_7 d\xi} \int_\xi q e^{\int_\xi a_7 d\xi} d\xi \right) d\xi \right]^{\frac{1}{2}} \right\}. \tag{32}
\]
The above equation is combined with (26) to form the solution of the general Riccati equation. This proves lemma 2.
The next step is combining lemma 1 and lemma 2 by equating equations (24) and (26),

\[ v = (g^n - 1) \alpha = C_2 \frac{\int_{\xi} a_\xi e^{-\int_{\xi} a_\eta d\xi} \int_{\eta} q e^{\int_{\eta} a_\eta d\xi} d\eta}{\int_{\eta} q e^{\int_{\eta} a_\eta d\xi} d\eta} \left( \frac{1}{2} \right) \]  

(33)

Since the function \( \alpha = \alpha(q) \), it is difficult to determine \( q \) from (33). Thus, take \( q \) as an arbitrary function, the solution for \( a_8 \) is then

\[ a_8 = C_3 \left( \frac{e^{\int_{\xi} a_\eta d\xi}}{\int_{\eta} q e^{\int_{\eta} a_\eta d\xi} d\eta} \right) \left[ \alpha \left( \int_{\eta} q e^{\int_{\eta} a_\eta d\xi} d\eta \right)^2 \right] \]  

(34)

which then reduce equation (11) into the Riccati equation with variable coefficients. According to the previous consideration of \( a_1 \), the function, \( q = q(a_1) \) can be implemented to recover \( a_1 \).

Note that the procedure of (12- 23) can be repeated and iterated by induction to reduce the higher order polynomial equation until the fourth order equation is achieved. Expanding the result to any order as in (9) and combined with (26) to represent the Riccati equation, \( v_\xi = qv^2 + a_nv + a_{n+1} \). The expression for \( a_{n+1} \) is thus defined as

\[ a_{n+1} = C_3 \left( \frac{e^{\int_{\xi} a_n d\xi}}{\int_{\eta} q e^{\int_{\eta} a_n d\xi} d\eta} \right) \left[ \alpha \left( \int_{\eta} q e^{\int_{\eta} a_n d\xi} d\eta \right)^2 \right] \]  

where \( q = q(a_1, a_2, a_3, \cdots) \) following the reduction process and we are done.

3. Analytical Solutions to the 3D Incompressible Navier-Stokes Equations

The results from theorem 1 can be implemented into the Navier-Stokes equations with the application of Riccati equation as a representation of higher order polynomial equations.

**Lemma 3.** Equation (8) is transformable into the system of Riccati and third order polynomial equations.

**Proof.** Consider the Riccati equation

\[ v_\xi = b_1 v^2 + b_2 v + b_3 \]  

(35)

such that the following relation is satisfied

\[ v_{\xi\xi} = b_1 v^2 + 2b_1 vv_\xi + b_2 v + b_3 v_\xi + b_3 \xi, \]

\[ v_{\xi\xi} = 2b_1^2 v^3 + \left( b_1 + 3b_1 b_2 \right) v^2 + \left( b_2 + 2b_1 b_3 + b_2^2 \right) v + b_3 v + b_2 b_3. \]  

(36)
The equivalent coefficients are, \( b_1 = q, \ b_2 = a, \ \text{and} \ \ b_3 = a_{n+1}. \) Substituting into (8) to get the following polynomial equation

\[
\begin{align*}
(2a_1 b_1^2 + a_2 b_1) v^3 + (a_1 b_2 + 2a_1 b_3 + a_1 b_2 + a_2 b_3 + a_3 b_2 + a_3 b_3 + \ a_5 w + a_4 b_2 w) v^2 \\
+ (a_1 b_1 + 3a_1 b_1 b_2 + a_2 b_2 + a_3 b_1 + a_4 b_1 w) v \\
= a_0 w + a_7 w - \ a_4 b_3 w - a_1 b_3 - a_2 b_3 - a_3 b_3 + l \ F_3 + F_2 + l_1 h_1 \ K_2
\end{align*}
\]

(37)

Therefore, equation (8) is transformed to the system of (35) and (37). This proves lemma 3.

Set \( 2a_1 b_1^2 + a_2 b_1 = 0 \) and \( a_1 b_1 + 3a_1 b_2 + a_2 b_2 + a_3 b_1 + a_4 b_1 w = 0, \) thus the expression for \( b_1 \) and \( b_2 \) are defined by

\[
b_1 = -\frac{a_2}{2a_1},
\]

(38)

\[
b_2 = -\frac{(a_1 b_1 + a_3 b_1 + a_4 b_1 w)}{3a_1 + a_2}.
\]

(39)

Therefore, equation (37) is reduced into

\[
v = \frac{a_0 w + a_7 w - a_4 b_3 w - a_1 b_3 - a_2 b_3 - a_3 b_3 + l \ F_3 + F_2 + l_1 h_1 \ K_2}{a_1 b_1^2 + 2a_1 b_1 + a_2 b_2^2 + a_2 b_3 + a_3 b_2 + a_5 w + a_4 b_2 w}.
\]

(40)

The expression for \( b_3 \) will be determined later as a requirement of unique solutions under general initial-boundary values. Also note that the solution for the system (35) and (40) will be similar to that of the velocity in \( z \) direction as derived in the subsequent paragraph.

### 3.1. The Formulation for \( w \) Velocity

The step now is performing equations (2) and (4) into (1b),

\[
\frac{\partial}{\partial t} \left[ \int_x (v_y + w) \, dx - K_1 \right] + \left[ - \int_x (v_y + w) \, dx + K_1 \right] (v_y + w) + v \ \frac{\partial}{\partial y} \left[ \int_y (v_y + w) \, dx - K_1 \right] + w \ \frac{\partial}{\partial z} \left[ \int_z (v_y + w) \, dx - K_1 \right] = \frac{\partial}{\partial x} \left\{ \int_z \left( F_3 + v \left( w_{xx} + w_{yy} + w_{zz} \right) + w \left[ \int_x (v_y + w) \, dx - K_1 \right] - w_t - \nu w_{yy} - \nu w_{zz} \right) dz \right\} \\
+ F_1.
\]

(41)
Performing the coordinate transformation (6),

\[
- \frac{c_1}{h_{1\xi}} (k_1 l_1 v_{\xi} + k_1 m_1 w_{\xi} - K_1) + \left[ - (k_1 l_1 v + k_1 m_1 w) + K_1 \right] \left( \frac{l_1}{h_{1\xi}} v_{\xi} + \frac{m_1}{h_{1\xi}} w_{\xi} \right) \\
+ v \frac{l_1}{h_{1\xi}} \left( k_1 l_1 v_{\xi} + k_1 m_1 w_{\xi} - K_1 \right) + \frac{m_1}{h_{1\xi}} \left( k_1 l_1 v_{\xi} + k_1 m_1 w_{\xi} - K_1 \right) \\
= k_1 \frac{K_{2\xi}}{h_{1\xi}} + v \left( \frac{k_1 l_1}{h_{1\xi}^2} v_{\xi\xi} + \frac{k_1 m_1}{h_{1\xi}^2} w_{\xi\xi} \right) + v \frac{l_1^2}{h_{1\xi}^2} \left( k_1 l_1 v_{\xi\xi} + k_1 m_1 w_{\xi\xi} - K_1 \right) \\
+ \frac{m_1^2}{h_{1\xi}^2} \left( k_1 l_1 v_{\xi\xi} + k_1 m_1 w_{\xi\xi} - K_1 \right) + \frac{k_1}{m_1} \left( F_3 + v \left( \frac{k_1}{h_{1\xi} m_1} + \frac{k_1 l_1^2}{h_{1\xi}^2 m_1} + \frac{k_1}{h_{1\xi}^2} \right) w_{\xi\xi} + \frac{k_1}{h_{1\xi}^2} w_{\xi} \left[ \left( \frac{k_1 l_1}{m_1} v + k_1^2 w \right) - K_1 \right] \right) + F_{1}. \\
\]

Thus by grouping the above equation, the momentum in \( z \) direction is given by

\[
a_9 w_{\xi\xi} + a_{10} w_{\xi} + a_{11} w_{\xi\xi} + \frac{k_1}{m_1} F_3 + F_1 + \frac{k_1}{h_{1\xi}^2} K_{2\xi} - \left( \frac{c_1}{h_{1\xi}} + \frac{l_1^2}{h_{1\xi}^2} + \frac{m_1^2}{h_{1\xi}^2} \right) K_1 \\
= a_{12} v_{\xi\xi} + a_{13} v_{\xi\xi} + (a_{14} + a_{15} w) v_{\xi} + a_{16} w_{\xi} v. \\
\]  

(42)

Since equation (43) is similar to that of (37), it is reasonable to state that the solution for \( v \) is also similar to (40). Repeating the procedure described by (35-40) with different variables, \( b_4, b_5 \) and \( b_6 \) yielding

\[
v = \frac{a_9 w_{\xi\xi} + a_{10} w_{\xi} + a_{11} w_{\xi\xi} - a_{15} b_6 w - a_{12} b_5 b_6 - a_{12} b_5 b_6 - a_{14} b_5 + \frac{k_1}{m_1} F_3 + F_1 + \frac{k_1}{h_{1\xi}} K_{2\xi} - K_7}{a_{12} b_5 + 2a_{12} b_4 b_6 + a_{12} b_5^2 + a_{13} b_6 + a_{14} b_5 + a_{16} w_{\xi} + a_{15} b_3 w}, \\
\]

where \( K_7 = \left( \frac{c_1}{h_{1\xi}} + \frac{l_1^2}{h_{1\xi}^2} + \frac{m_1^2}{h_{1\xi}^2} \right) K_1. \) Equating (40) and (44) to get

\[
v = \frac{a_9 w_{\xi\xi} + a_{10} w_{\xi} + a_{11} w_{\xi\xi} - a_4 b_3 w - a_1 b_2 b_3 - a_3 b_3 + \frac{l_1}{m_1} F_3 + F_2 + \frac{l_1}{h_{1\xi}} K_{2\xi}}{a_1 b_2 + 2a_1 b_1 b_3 + a_1 b_2^2 + a_2 b_3 + a_3 b_2 + a_5 w_{\xi} + a_4 b_2 w} \\
= \frac{a_9 w_{\xi\xi} + a_{10} w_{\xi} + a_{11} w_{\xi\xi} - a_{15} b_6 w - a_{12} b_5 b_6 - a_{12} b_5 b_6 - a_{14} b_5 + \frac{k_1}{m_1} F_3 + F_1 + \frac{k_1}{h_{1\xi}} K_{2\xi} - K_7}{a_{12} b_5 + 2a_{12} b_4 b_6 + a_{12} b_5^2 + a_{13} b_6 + a_{14} b_5 + a_{16} w_{\xi} + a_{15} b_3 w} \\
\]

(45)

which then can be performed algebraically to form a single expression.

In this research, we are interested to the class of solutions that is physically important [3, 4],

\[
w = r(\xi) e^{ih(\xi)}. \\
\]

(46)
Substituting (46) into (45) to get
\[ r_\xi \left( a_{17} r_\xi + a_{18} r_\xi + a_{19} r_\xi + a_{20} r + a_{21} \right) + r \left( a_{22} r_\xi + a_{23} r_\xi + a_{24} r_\xi + a_{25} r + a_{26} \right) + a_{27} r_\xi + a_{28} r_\xi + a_{29} r_\xi + a_{30} r + a_{31} = 0. \] (47)

By setting,
\[ r_\xi = b_7 r^2 + b_8 r + b_9 \] (48)
such that the following relation is fulfilled
\[ r_{\xi \xi} = 2 b_7^2 r^3 + \left( b_7 + 3 b_7 b_8 \right) r^2 + \left( b_8 + 2 b_7 b_9 + b_9^2 \right) r + b_9 + b_8 b_9. \] (49)

Note that equation (48) is also an equivalent form of higher order equation as stated in theorem 1. Thus, applying (48) and (49) into (47), the resulting polynomial equation is defined by
\[ a_{32} r^5 + a_{33} r^4 + a_{34} r^3 + a_{35} r^2 + a_{36} r + a_{37} = 0, \] (50)
where \( a_{37} \) is given by
\[ a_{37} = a_{17} \left( b_9 b_9 + b_8 b_9^2 \right) + a_{19} b_8^2 + a_{21} b_9 + a_{27} \left( b_9 + b_8 b_9 \right) + a_{29} b_9 + a_{31}. \] (51)

Lemma 1 can be implemented to reduce equation (50) to the fourth order polynomial which the root is solvable by radicals, say be written as \( r = \varepsilon(\xi) \). Meanwhile, \( b_7 \) will be defined later by the similar condition as applied to \( b_3 \).

### 3.2. The Solution for the Riccati Equation

In order to solve the system of (48) and (50), the following step is necessary [5],

**Lemma 4.** Consider equation (48) and set \( b_8 = f_1 - \frac{f_2 \xi}{f_2} \) to generate
\[ Z_\xi = b_7 f_2 Z^2 + f_1 Z + f_2 b_9, \]
where \( Z = f_2 r \). Set a relation \( f_2 b_9 = \Phi Z \), and according to the result of lemma 2, the function \( \Phi \) is expressed as,
\[ \Phi = \frac{C_2}{\Phi} \left\{ \int \left[ f_2 \Phi b_9 e^{-f_1 d \xi} \int \frac{b_7}{f_2} \Phi e^{f_1 d \xi} d \xi \right] d \xi \right\} \frac{1}{f_2}. \]

**Proof.** Set \( b_8 = f_1 - \frac{f_2 \xi}{f_2} \) to rearrange equation (48) as
\[ r_\xi + \frac{f_2 x}{f_2} r = \frac{1}{f_2} (f_2 r) \xi = b_7 r^2 + f_1 r + b_9. \] (52)
Suppose that \( Z = f_2 r \), then the following equation is produced
\[
Z_\xi = \frac{b_7}{f_2} Z^2 + f_1 Z + f_2 b_9. \tag{53}
\]
Set \( f_2 b_9 = \phi Z \), the original problem is transformed into
\[
Z_\xi = \frac{b_7}{f_2} Z^2 + (f_1 + \phi) Z. \tag{54}
\]
The solution of (8c) is expressed as
\[
Z = \frac{f_2 b_9}{\phi} = -\frac{e^{\int_\xi (f_1 + \phi) d\xi}}{\int_\xi f_2 e^{\int_\xi (f_1 + \phi) d\xi} d\xi}. \tag{55}
\]
Applying the result of lemma 2 and define the function, \( f_2 e^{\int_\xi f_1 d\xi} = A \Phi \) to produce
\[
A \frac{B}{\Phi} = -\frac{f_2 b_9 e^{-\int_\xi f_1 d\xi} \int_\xi f_2 \Phi e^{\int_\xi f_1 d\xi} d\xi}{\int_\xi A \Phi d\xi}, \tag{56}
\]
where \( \Phi \) will be defined later. The solution for \( \phi \) is then
\[
\phi = \frac{A}{B} = C_4 \left\{ \int_\xi \left( f_2 \Phi b_9 e^{-\int_\xi f_1 d\xi} \int_\xi f_2 \Phi e^{\int_\xi f_1 d\xi} d\xi \right) d\xi \right\}^{\frac{1}{2}}. \tag{57}
\]
The above equation is combined with (55) to form the solution of the general Riccati equation. This proves lemma 4.

3.3. The Complete Solution

The system which is represented by (48) and (50) will have a simultaneous solution as it is driven by equation (52-57) and equation (50). The claim is concluded in the following theorem:

**Theorem 2.** Consider the solution of the Riccati equation as described by (55) and (57). By combining with the root of (50), \( r = \varepsilon (\xi) \), then the expressions of \( f_2 \) and \( \Phi \) can be determined. The resulting expressions thus complete the solution of the system defined by (48) and (50).

**Proof.** Equating the results from (50) and lemma 4 as follows
\[
\frac{b_9}{\alpha} = \varepsilon \quad \text{or} \quad b_9 = \varepsilon \phi = \varepsilon C_4 \frac{\phi}{\Phi} \left\{ \int_\xi \left( f_2 \Phi b_9 e^{-\int_\xi f_1 d\xi} \int_\xi f_2 \Phi e^{\int_\xi f_1 d\xi} d\xi \right) d\xi \right\}^{\frac{1}{2}}. \tag{58}
\]
Integrate the above equation and perform the algebraic calculations to give

\[ \int_{\xi}^{b} \frac{\Phi}{f_{2}} \left( \int_{\xi}^{f_{1}} e d\xi \right)^{2} = \frac{\varphi}{f_{2}} \int_{\xi}^{f_{1}} e d\xi \]  

(59)

with \( \varphi = \frac{C_{5}}{\Phi b_{0}} \left( \int_{\xi}^{f_{1}} \frac{eb_{2}}{e} d\xi \right)^{2} \). Differentiate (59) once to get the relations of \( f_{1} \) and \( f_{2} \) as in the following

\[ \left( \frac{1}{f_{2}} \right)_{\xi} = \frac{1}{f_{2}} \left( \frac{\Phi b_{7}}{\varphi} - \frac{\varphi}{\varphi} - f_{1} \right). \]  

(60)

The solution for \( f_{2} \) is then

\[ f_{2} = \varphi e^{\int_{f_{1}}^{d\xi} e^{\int_{\xi}^{f_{1}} \Phi b_{7} d\xi} - \int_{f_{1}}^{\xi} \frac{eb_{2}}{e} d\xi}. \]  

(61)

Equating the above equation with \( b_{8} = f_{1} - \frac{f_{2} e}{f_{2}} \) to get the following expression

\[ b_{8} = f_{1} + \left( \frac{\Phi b_{7}}{\varphi} - \frac{\varphi}{\varphi} - f_{1} \right) \]  

(62)

which has also solved \( \varphi \) as in the following,

\[ \varphi = \frac{C_{5}}{\Phi b_{0}} \left( \int_{\xi}^{f_{1}} \frac{eb_{2}}{e} d\xi \right)^{2} \int_{\xi}^{\Phi b_{7}} \Phi b_{7} e^{\int_{\xi}^{f_{1}} \Phi b_{7} d\xi} d\xi. \]  

(63)

It is important to mention that the solution for \( f_{1} \) does not exist. This condition is consistent with equation (61), since \( f_{1} \) will vanish when (61) is substituted into (57). The above equation can be rearranged as

\[ \frac{2C_{5}}{e} \int_{\xi}^{f_{1}} \frac{eb_{2}}{e} d\xi \left( \int_{\xi}^{f_{1}} e d\xi \right)^{2} = \int_{\xi}^{f_{1}} \Phi b_{7} e^{\int_{\xi}^{f_{1}} d\xi} d\xi. \]  

(64)

Equation (64) forms the linear first order equation in \( \Phi \), the solution is then expressed as

\[ \Phi = \frac{e}{b_{0}} \left[ \left( \frac{2C_{5}}{e} \right) \left( \frac{eb_{7}}{b_{0} - 2C_{5}} \right) \right] \exp \int_{\xi}^{f_{1}} \frac{\left( \frac{2C_{5}}{e} \right) + \frac{2b_{5} C_{5}}{e}}{\left( \frac{eb_{7}}{b_{0} - 2C_{5}} \right)} d\xi. \]  

(65)

\[ = \frac{1}{b_{0}} \left( \frac{2b_{7} e C_{5} - 2e C_{5}}{e^{2} b_{7} - 2C_{5}} \right) e^{\int_{\xi}^{f_{1}} \left( \frac{2b_{7} e C_{5} - 2e C_{5}}{e^{2} b_{7} - 2C_{5}} \right) d\xi}. \]

Therefore, the explicit solution of the system (48) and (50) is given by

\[ r = \frac{b_{0}}{\Phi} = -\frac{e^{\int_{\xi}^{f_{1}} (f_{1} + \varphi) d\xi}}{f_{2} \int_{\xi}^{f_{1}} \frac{eb_{2}}{e} e^{\int_{\xi}^{f_{1}} (f_{1} + \varphi) d\xi} d\xi} = -\frac{\varphi}{\varphi} \frac{b_{0}}{\Phi} e^{\int_{\xi}^{f_{1}} (f_{1} + \varphi) d\xi} d\xi, \]  

(66)
where the function $\phi$ is determined by

$$
\phi = \frac{C_4}{\Phi} \left\{ \left[ \int_{\xi} \phi \Phi b \eta e^{-\int_{\xi} f_2 d\xi} \int_{\xi} \Phi b \eta e^{-\int_{\xi} f_1 d\xi} d\xi \right]^{1/2} \right\}_{\xi}
$$

$$
\xi = \frac{C_4}{\Phi} \frac{1}{\Phi} \left[ \left( \int_{\xi} \phi \Phi b \eta d\xi \right)^{1/2} \right]_{\xi}
$$

This completes the proof of theorem 1.

Note that the procedure that explained by equation (52-57) and equation (58-67) can also be applied to system (35) and (40). Therefore, by substituting (66) into (46) the solution of mass and momentum equations, $w, v, p$ and $u$ are defined by (46), (40) or (44), (4) and (2). Therefore, based on the obtained solutions, the result then can be generalised as in the following

$$
w = w_1 + w_2 + \cdots
$$

$$
v = v_1 + v_2 + \cdots
$$

$$
u = u_1 + u_2 + \cdots
$$

$$
p = p_1 + p_2 + \cdots
$$

which can also be solved by the same procedure.

4. Remarks on Integral Evaluation of Analytical Solutions

It is important to note that the integrals which appear in the analytical solutions are usually approximated in series forms [17], by which the solution is then no longer exact. In order to resolve the problem, now the following integral is considered [10],

$$
A = \int_{\xi} \lambda e^{\int_{\xi} f d\xi} d\xi.
$$

By setting

$$
A = \int_{\xi} \lambda e^{\int_{\xi} f d\xi} d\xi = (R + Q) \eta e^{\int_{\xi} g d\xi},
$$

where $C_3$ is a constant, equation (70) can be differentiated once to give

$$
\lambda e^{\int_{\xi} f d\xi} = (R + Q) \eta e^{\int_{\xi} g d\xi} + (R + Q) \eta e^{\int_{\xi} g d\xi} + (R + Q) \eta e^{\int_{\xi} g d\xi}.
$$
Rearranging the above equation as

\[ R_\xi + \left( \frac{\eta\xi}{\eta} + g \right) R = \frac{\lambda}{\eta} e^{\int_\xi f - g d\xi} - \left\{ Q_\xi + \left( \frac{\eta\xi}{\eta} + g \right) Q \right\}. \tag{71} \]

The solution of \( p \) is then expressed by

\[ R = \frac{1}{\eta} e^{-\int_\xi g d\xi} \int_\xi \eta e^{\int_\xi g d\xi} \left[ \frac{\lambda}{\eta} e^{\int_\xi f - g d\xi} - \left\{ Q_\xi + \left( \frac{\eta\xi}{\eta} + g \right) Q \right\} \right] d\xi. \tag{72} \]

Let

\[ \frac{\lambda}{\eta} e^{\int_\xi f - g d\xi} - \left\{ Q_\xi + \left( \frac{\eta\xi}{\eta} + g \right) Q \right\} = f_3. \tag{73} \]

Then, \( R \) is evaluated in the following

\[ R = \frac{1}{\eta} e^{-\int_\xi g d\xi} \left\{ \left( \int_\xi f_3 \eta d\xi \right) e^{\int_\xi g d\xi} - \int_\xi \left( \int_\xi f_3 \eta d\xi \right) \eta e^{\int_\xi g d\xi} d\xi \right\}. \tag{74} \]

Suppose that from equation (73),

\[ \frac{\lambda}{\eta} e^{\int_\xi f - g d\xi} = C_6, \]

where \( C_4 \) is also a constant. The expression for \( e^{\int_\xi g d\xi} \) is written as

\[ \frac{\lambda}{C_6 \eta} e^{\int_\xi f d\xi} = e^{\int_\xi g d\xi}. \tag{75} \]

Thus, equation (74) will become

\[ R = \frac{1}{C_6 \eta} e^{-\int_\xi g d\xi} \left\{ \left( \int_\xi f_3 \eta d\xi \right) \frac{\lambda}{\eta} e^{\int_\xi f d\xi} - \int_\xi \left( \int_\xi f_3 \eta d\xi \right) \left( \frac{\lambda}{\eta} e^{\int_\xi f d\xi} \right) d\xi \right\}. \tag{76} \]

Without loss of generality, set \( \int_\xi f_3 \eta d\xi = \ln \left( \frac{\lambda}{\eta} e^{\int_\xi f d\xi} \right) \), and the expression of \( f_3 \) is obtained as

\[ f_3 = \frac{1}{\eta} \left\{ \ln \left( \frac{\lambda}{\eta} e^{\int_\xi f d\xi} \right) \right\}. \tag{77} \]

The solution for \( Q \) is consequently obtained from (73) as in the following relation

\[ Q = \frac{1}{\eta} e^{-\int_\xi g d\xi} \int_\xi (C_4 - f_3) \eta e^{\int_\xi g d\xi} d\xi. \]

Substituting (75) to get

\[ Q = \frac{1}{C_6 \eta} e^{-\int_\xi g d\xi} \int_\xi (C_6 - f_3) \lambda e^{\int_\xi f d\xi} d\xi. \tag{78} \]
Equations (70), (76) and (78) will give the evaluation as

\[
\int_{\xi}^{\gamma} \lambda e^{\int_{\xi}^{\gamma} d\xi} d\xi = (R + Q) \eta e^{\int_{\xi}^{Q} g d\xi} = \frac{1}{C_6} \frac{\lambda}{\eta} e^{\int_{\xi}^{\gamma} d\xi} + \frac{1}{C_6} \int_{\xi}^{\gamma} (C_6 - f_3) \lambda e^{\int_{\xi}^{\gamma} d\xi},
\]

(79)

where \(f_3\) is determined by (77).

Equation (79) can be differentiated once and rearranged to be

\[
\int_{\xi} \lambda e^{\int_{\xi}^{\gamma} d\xi} d\xi = \int_{\xi} \frac{1}{f_3} \left( \frac{\lambda}{\eta} e^{\int_{\xi}^{\gamma} d\xi} \right) d\xi.
\]

(80)

Now suppose that \(\frac{\lambda}{\eta} e^{\int_{\xi}^{\gamma} d\xi} = L\) and \(f_3 = \frac{1}{\eta} \left\{ \ln \left( \frac{\lambda}{\eta} e^{\int_{\xi}^{\gamma} d\xi} \right) \right\} = L^n\), with \(n\) is an arbitrary constant. The relation of \(\lambda\) is then given by

\[
\lambda^n e^{\int_{\xi}^{\gamma} d\xi} \eta^{1-n} = -\frac{\eta \xi}{n} + \left( \frac{\lambda \xi}{\lambda} + f \right).
\]

(81)

Let \(\eta = (\gamma + \chi)^{1-n}\), equation (81) will then produce

\[
\chi = (n-1) \lambda^n e^{\int_{\xi}^{\gamma} d\xi} \chi^2 + (1-n) \left\{ \left( \frac{\lambda \xi}{\lambda} + f \right) - 2\lambda^n e^{\int_{\xi}^{\gamma} d\xi} \right\} \chi
\]

\[
+ (1-n) \left( \frac{\lambda \xi}{\lambda} + f \right) \gamma + (n-1) \lambda^n e^{\int_{\xi}^{\gamma} d\xi} \gamma^2 - \gamma \chi.
\]

(82)

The solution for \(\chi\) is similar to that of formulation described by the method in lemma 4,

\[
\chi = \frac{(1-n) \left( \frac{\lambda \xi}{\lambda} + f \right) \gamma + (n-1) \lambda^n e^{\int_{\xi}^{\gamma} d\xi} \gamma^2 - \gamma \chi}{\left\{ \left[ C_7 \int_{\xi} \left\{ \left(1-n\right) \left( \frac{\lambda \xi}{\lambda} + f \right) \gamma + (n-1) \lambda^n e^{\int_{\xi}^{\gamma} d\xi} \gamma^2 - \gamma \chi \right \} K_9 \right] d\xi \right\}^{1/2}},
\]

(83)

where \(K_9 = \lambda^{(n-1)} e^{(n-1) \int_{\xi}^{\gamma} d\xi} - 2 \int_{\xi}^{\gamma} \lambda^n e^{\int_{\xi}^{\gamma} d\xi} \gamma \int_{\xi}^{\gamma} \lambda e^{\int_{\xi}^{\gamma} d\xi} e^{\int_{\xi}^{\gamma} \lambda e^{\int_{\xi}^{\gamma} d\xi} d\xi} d\xi\). Without loss of rigor, set \(\gamma = -\frac{1}{2} \left( \frac{\lambda \xi}{\lambda} + f \right) \lambda^n e^{\int_{\xi}^{\gamma} d\xi}\) to produce a more simplified solution

\[
\chi = \frac{C_8 \left\{ \int_{\xi} \left( (n-1) \frac{1}{2} \left( \frac{\lambda \xi}{\lambda} + f \right)^2 + \left( \frac{1}{2} \left( \frac{\lambda \xi}{\lambda} + f \right) \lambda^n e^{\int_{\xi}^{\gamma} d\xi} \right) \lambda^n e^{\int_{\xi}^{\gamma} d\xi} \right) d\xi \right\}^{1/2}}{\lambda^n e^{\int_{\xi}^{\gamma} d\xi} \xi}
\]

(84)

The step is now performing the integration of (80) to give

\[
\int_{\xi}^{\gamma} \lambda e^{\int_{\xi}^{\gamma} d\xi} d\xi = \frac{1}{1-n} L^{1-n} = \frac{1}{1-n} \left( \frac{\lambda}{\eta} e^{\int_{\xi}^{\gamma} d\xi} \right)^{1-n}.
\]

(85)
Substitute the relation \( \eta = (\gamma + \chi) \frac{1}{1 - \eta} \) into (85) and rearranging the result to produce

\[
\left( C_9 \int_{\xi} K_{10} d\xi \right)^{\frac{1}{n}} \left[ 1 - \frac{1}{2} \xi \left( \frac{\lambda \xi}{\lambda} + f \right) \right] \frac{1}{\lambda} \lambda e^{\xi f d\xi} d\xi = \frac{\xi}{1 - \eta} \lambda e^{\xi f d\xi}
\]

with \( K_{10} = (n - 1) \frac{3}{4} \left( \frac{\lambda \xi}{\lambda} + f \right)^2 \xi + \left( \frac{1}{2} \frac{\lambda \xi}{\lambda} + f \right) \lambda^{-n} e^{-n f} \int_{\xi} f d\xi \). Rearrange and differentiate the above equation once to get

\[
D = C_{10} \left( \frac{\xi \lambda e^{\xi f d\xi}}{\int_{\xi} \lambda e^{\xi f d\xi} d\xi} + \frac{1}{2} \xi \left( \frac{\lambda \xi}{\lambda} + f \right) \right)
\times \left( \frac{\xi \lambda e^{\xi f d\xi}}{\int_{\xi} \lambda e^{\xi f d\xi} d\xi} - \frac{\xi \lambda e^{\xi f d\xi}^2}{\left( \int_{\xi} \lambda e^{\xi f d\xi} d\xi \right)^2} + \left( \frac{1}{2} \xi \left( \frac{\lambda \xi}{\lambda} + f \right) \right) \right),
\]

where \( D \) is expressed by \( D = (n - 1) \frac{3}{4} \left( \frac{\lambda \xi}{\lambda} + f \right)^2 \xi + \left( \frac{1}{2} \frac{\lambda \xi}{\lambda} + f \right) \lambda^{-n} e^{-n f} \int_{\xi} f d\xi \). It is not hard to see that equation (86) will produce a polynomial equation as in the following

\[
\left( \int_{\xi} \lambda e^{\xi f d\xi} d\xi \right)^3 = C_{10} \left( E + F \left( \int_{\xi} \lambda e^{\xi f d\xi} d\xi \right) \right)
\times \left( \left( \int_{\xi} \lambda e^{\xi f d\xi} d\xi \right) \left( \xi \lambda e^{\xi f d\xi} \right) + \left( -\xi \lambda e^{\xi f d\xi} \right) + \left( \int_{\xi} \lambda e^{\xi f d\xi} d\xi \right)^2 \left( \frac{1}{2} \xi \left( \frac{\lambda \xi}{\lambda} + f \right) \right) \right)
\]

with \( E = \xi \lambda e^{\xi f d\xi} \) and \( F = \frac{1}{2} \xi \left( \frac{\lambda \xi}{\lambda} + f \right) \). Thus, the integral of \( \int_{\xi} \lambda e^{\xi f d\xi} d\xi \) can be defined by the root of equation (87). By taking one root of (87) as

\[
\int_{\xi} \lambda e^{\xi f d\xi} d\xi = C_{10} \left( \frac{\xi \lambda e^{\xi f d\xi}}{3} \left( \frac{1}{2} \xi \left( \frac{\lambda \xi}{\lambda} + f \right) \right) \left( \frac{1}{2} \xi \left( \frac{\lambda \xi}{\lambda} + f \right) \right) \int_{\xi} \lambda e^{\xi f d\xi} d\xi \right)
\]

\[+ \left[ G + \left( H^3 + G^2 \right)^{\frac{1}{2}} \right]^{\frac{1}{3}} + \left[ G - \left( H^3 + G^2 \right)^{\frac{1}{2}} \right]^{\frac{1}{3}}.
\]
Meanwhile, $G$ and $H$ are defined by

\[
G = \frac{C_{10}^2}{6} \left\{ \frac{K_{11} \left( \frac{\xi \lambda e^{\int_{\xi}^{f} d\xi}}{\xi} \left( \frac{\lambda}{\xi} + f \right) \right) + \left( \frac{1}{2} \xi \frac{\lambda}{\xi} + f \right) \left( \xi \lambda e^{\int_{\xi}^{f} d\xi} \right)_{\xi}}{\left[ K_{10} - \xi \lambda e^{\int_{\xi}^{f} d\xi} \right]} \right\} + \frac{C_{10}^2}{2} \left[ K_{10} - \xi \lambda e^{\int_{\xi}^{f} d\xi} \right] + \frac{C_{10}^2}{27} \left[ K_{10} - \left( \frac{1}{2} \xi \frac{\lambda}{\xi} + f \right) \right]^{\frac{3}{2}} \left( \xi \lambda e^{\int_{\xi}^{f} d\xi} \right)_{\xi}^{3}, \tag{89}
\]

and

\[
H = \frac{C_{10}^3}{3} \left[ K_{10} - \xi \lambda e^{\int_{\xi}^{f} d\xi} \right] + \left( \frac{1}{2} \xi \frac{\lambda}{\xi} + f \right) \left( -\xi \lambda e^{\int_{\xi}^{f} d\xi} \right)_{\xi} + \frac{C_{10}^2}{2} \left[ K_{10} - \left( \frac{1}{2} \xi \frac{\lambda}{\xi} + f \right) \right]^{\frac{3}{2}} \left( \xi \lambda e^{\int_{\xi}^{f} d\xi} \right)_{\xi}^{3} \tag{90}
\]

with $K_{11} = \left[ \left( \xi \lambda e^{\int_{\xi}^{f} d\xi} \right) \left( \xi \lambda e^{\int_{\xi}^{f} d\xi} \right)_{\xi} + \left( \frac{1}{2} \xi \frac{\lambda}{\xi} + f \right) \right] \left( -\xi \lambda e^{\int_{\xi}^{f} d\xi} \right)_{\xi}$. This will solve the integral in (69). Therefore, the following theorem is just proved.

**Theorem 3.** Consider the following integral equation

\[
A = \int_{\xi} \lambda (\xi) e^{\int_{\xi}^{f} \xi d\xi} d\xi.
\]

There exists a functional $\eta = \gamma + \chi$, with $\gamma$ and $\chi$ are given by

\[
\gamma = \frac{1}{2} \left( \frac{\lambda}{\xi} + f \right) \lambda^{-n} e^{-n \int_{\xi}^{f} d\xi}, \chi = C_{8} \left\{ \int_{\xi} \left( n - 1 \right) \frac{3}{4} \left( \frac{\lambda}{\xi} + f \right)^{2} \lambda^{-n} e^{-n \int_{\xi}^{f} d\xi} \right\}^{\frac{1}{2}}.
\]
such that the integral $A$ can be evaluated as

$$
\int_{\xi} \lambda e^{\xi f d\xi} d\xi = \frac{C_{10}}{3} \left( \xi \lambda e^{\xi f d\xi} \right) \left( \frac{\lambda f}{2} \left( \frac{\lambda f}{\xi} + f \right) \right) + \left( \frac{\lambda f}{2} \left( \frac{\lambda f}{\xi} + f \right) \right) \left( \xi \lambda e^{\xi f d\xi} \right) \xi
$$

where $C_8, C_{10}$ and $n$ are arbitrary constants and $G$ and $H$ are defined by (93) and (90).

**5. Remarks on the Properties of the Solutions**

Now we are at step to answer and proof the questions of existence and uniqueness of smooth solutions with the result from integral evaluation. Since some functions of the solution are arbitrary, they can become powerful objects to justify the properties under general initial-boundary conditions [6].

**5.1. Uniqueness Property**

Consider that the velocity vectors and pressure have already been described by two solutions with identical boundary conditions i.e. $(u_1, u_2), (v_1, v_2), (w_1, w_2)$ and $(p_1, p_2)$. Substituting the solution pairs into the continuity and Navier-Stokes equations (1a-1d) and set the following relations

$$
P = p_1 - p_2$$

$$
U = u_1 - u_2$$

$$
V = v_1 - v_2$$

$$
W = w_1 - w_2. \quad (91)
$$

Suppose that the solutions are also supplemented by cauchy conditions as follows

$$
u_1 \left( x_i, 0 \right) = u_2 \left( x_i, 0 \right) = u_0 \left( x_i \right)$$

$$
\nu_1 \left( x_i, 0 \right) = v_2 \left( x_i, 0 \right) = 0$$

$$
\nu_1 \left( x_i, 0 \right) = w_2 \left( x_i, 0 \right) = 0. \quad (92)
$$

Hence, the following theorem is justified.

**Theorem 4.** Implements equation (92) into (91) in order to satisfy the following initial conditions

$$
U \left( x_i, 0 \right) = u_1 \left( x_i, 0 \right) - u_2 \left( x_i, 0 \right) = 0$$

$$
V \left( x_i, 0 \right) = v_1 \left( x_i, 0 \right) - v_2 \left( x_i, 0 \right) = 0$$

$$
W \left( x_i, 0 \right) = w_1 \left( x_i, 0 \right) - w_2 \left( x_i, 0 \right) = 0.$$
The condition \( \frac{a}{x} + f = 0 \) then can be applied such that the expression \( \frac{b}{x} = C_{12} \Phi \) and
\[
b_3 = -e^{-f} \left( \frac{b_2 + a_4}{m_4} \right) \xi \int_\xi \left[ \frac{1}{a_1} \left( \frac{1}{m_1} I_3 + I_2 - \frac{1}{h_{11}} K_{23} \xi \right) e^{\frac{b_2 + a_4}{m_4} \xi} \right] d\xi \]
is produced. The continuity and incompressible Navier-Stokes equations will have at most one solution for velocities and more than one for pressure.

**Proof.** The following equations are produced by substraction and by utilisation of (91),
\[
\frac{\partial U}{\partial x} + \frac{\partial V}{\partial y} + \frac{\partial W}{\partial z} = 0,
\]
(93)\[
\frac{\partial U}{\partial t} + \frac{U}{\partial x} + V \frac{\partial U}{\partial y} + W \frac{\partial U}{\partial z} = -\frac{1}{\rho} \frac{\partial P}{\partial x} + \frac{\partial^2 U}{\partial y^2} + \frac{\partial^2 U}{\partial z^2} - I_1,
\]
(94)\[
\frac{\partial V}{\partial t} + \frac{U}{\partial x} + V \frac{\partial V}{\partial y} + W \frac{\partial V}{\partial z} = -\frac{1}{\rho} \frac{\partial P}{\partial y} + \frac{\partial^2 V}{\partial y^2} + \frac{\partial^2 V}{\partial z^2} - I_2,
\]
(95)\[
\frac{\partial W}{\partial t} + \frac{U}{\partial x} + V \frac{\partial W}{\partial y} + W \frac{\partial W}{\partial z} = -\frac{1}{\rho} \frac{\partial P}{\partial z} + \frac{\partial^2 W}{\partial y^2} + \frac{\partial^2 W}{\partial z^2} - I_3,
\]
(96)\[
\text{where } I_1, I_2 \text{ and } I_3 \text{ are defined by}
\]
\[
I_1 = (u_1 + 2u_2) \frac{\partial u_2}{\partial x} + (v_1 + 2v_2) \frac{\partial u_2}{\partial y} + (w_1 + 2w_2) \frac{\partial u_2}{\partial z} + u_2 \frac{\partial u_1}{\partial x} + v_2 \frac{\partial u_1}{\partial y} + w_2 \frac{\partial u_1}{\partial z},
\]
(97)\[
I_2 = (u_1 + 2u_2) \frac{\partial v_2}{\partial x} + (v_1 + 2v_2) \frac{\partial v_2}{\partial y} + (w_1 + 2w_2) \frac{\partial v_1}{\partial z} + u_2 \frac{\partial v_1}{\partial x} + v_2 \frac{\partial v_1}{\partial y} + w_2 \frac{\partial v_1}{\partial z},
\]
(98)\[
I_3 = (u_1 + 2u_2) \frac{\partial w_2}{\partial x} + (v_1 + 2v_2) \frac{\partial w_2}{\partial y} + (w_1 + 2w_2) \frac{\partial w_1}{\partial z} + u_2 \frac{\partial w_1}{\partial x} + v_2 \frac{\partial w_1}{\partial y} + w_2 \frac{\partial w_1}{\partial z}.
\]
(99)\[
\text{Note that the external forces } F_1, F_2 \text{ and } F_3 \text{ are vanish by the substraction procedure. Applying the same method as derived before, the solution of (93-96) can be rewritten as}
\]
\[
W = \frac{b_3}{\Phi} e^{i h_1(\xi)} = C_{11} e^{i h_1(\xi)} \frac{1}{\varphi} \left( \int_\xi \varphi \Phi b_3 d\xi \right)^{\frac{1}{2}},
\]
(100)\[
V = \frac{a_9}{a_{10}} W_{\xi} + a_{10} W_{\xi} + a_{11} W_{\xi} - a_{15} b_6 W - a_{12} b_5 b_6 - a_{14} b_6
\]
\[
a_{12} b_5, 2a_{12} b_5 b_6 + a_{12} b_5 \xi + a_{13} b_6 + a_{14} b_5 + a_{16} W_{\xi} + a_{15} b_5 W
\]
\[
\frac{1}{m_3} I_3 - I_1 + \frac{1}{h_{11}} K_{23} \xi - \left( \frac{1}{h_{11}} + \frac{1}{h_{11}} + \frac{1}{m_{11}} \right) K_{1}
\]
\[
+ a_{12} b_5 \xi + 2a_{12} b_4 b_6 + a_{12} b_5 \xi + a_{13} b_6 + a_{14} b_5 + a_{16} W_{\xi} + a_{15} b_5 W
\]
or

\[ V = \frac{a_6 W_{x \xi} + a_7 W_{\xi} + a_9 W W_{\xi} - a_4 b_2 W - a_1 b_2 b_3 - a_3 b_3 - \frac{l_1}{m_1} I_3 - I_2 + \frac{l_1}{h_{1 \xi}} K_{2 \xi}}{a_1 b_{2 \xi} + 2 a_1 b_1 b_3 + a_2 b_3 + a_3 W_{\xi} + a_4 b_2 W}, \]

(101)

\[ P = \rho \int_{z} \left\{ v \left( W_{xx} + W_{yy} + W_{z z} \right) + W_{x} \left[ \int_{x} \left( V_{y} + W_{z} \right) dx - C_{1} \right] - W_{t} - V W_{y} - W W_{z} - I_{3} \right\} dz + K_{2}, \]

(102)

\[ U = - \int_{x} \left( V_{y} + W_{z} \right) dx + K_{1}. \]

(103)

In order to ensure uniqueness, it is necessary to set, for example, \( W = w_{1} - w_{2} = 0 \) with initial value \( W (x_{i}, 0) = w_{1} (x_{i}, 0) - w_{2} (x_{i}, 0) = 0 \) such that \( w_{1} = w_{2} \) with \( w_{1} (x_{i}, 0) = w_{2} (x_{i}, 0) \) are fulfilled [8]. Thus, the denominator of (100) can be considered as, \( \varphi = \frac{2 C_{5}}{\epsilon} \varphi_{b_{0}} d \xi = \infty \) which from the integral evaluation (88), (89) and (90), it is not hard to verify that the following expression must be fulfilled

\[ (n - 1) \frac{3}{4} \left( \frac{\lambda_{\xi} + f}{\lambda} \right)^{2} \xi + \left( \frac{1}{2} \frac{\lambda_{\xi} + f}{\lambda} \right) \xi^{n} e^{-n \int_{\xi} f d \xi} \xi - \left( \frac{1}{2} \frac{\lambda_{\xi} + f}{\lambda} \right) \left( \frac{1}{2} \frac{\lambda_{\xi} + f}{\lambda} \right) = 0, \]

(104)

where \( \lambda = \frac{b_{0}}{\epsilon} \) and \( f = \frac{\Phi_{2}}{\Phi} \). It is save to suppose that, \( \frac{(b_{0} / \epsilon)_{\xi}}{b_{0} / \epsilon} + \frac{\Phi_{2}}{\Phi} = 0 \) such that the following relation is fulfilled

\[ \frac{b_{0}}{\epsilon} = C_{12} \Phi, \]

(105)

where \( C_{12} \) is a constant. Note that equation (105) satisfies both initial condition and uniqueness since the criteria are the same, i.e. \( W = 0 \) and \( W (x_{i}, 0) = 0 \). Substituting \( W = 0 \) into equation (101) with \( V = 0 \) and \( V (x_{i}, 0) = v_{1} (x_{i}, 0) - v_{2} (x_{i}, 0) = 0 \), yielding

\[ 0 = \frac{a_{6} W_{xx} + a_{7} W_{\xi} + a_{9} W W_{\xi} - a_{4} b_{2} W - a_{1} b_{2} b_{3} - a_{3} b_{3} - \frac{l_{1}}{m_{1}} I_{3} - I_{2} + \frac{l_{1}}{h_{1 \xi}} K_{2 \xi}}{a_{1} b_{2 \xi} + 2 a_{1} b_{1} b_{3} + a_{2} b_{3} + a_{3} W_{\xi} + a_{4} b_{2} W}. \]

(106)

Dropping the term involving \( W \), the first order differential is produced as in the following

\[ b_{3 \xi} + \left( b_{2} + \frac{a_{3}}{a_{1}} \right) b_{3} = - \frac{1}{a_{1}} \left( \frac{l_{1}}{m_{1}} I_{3} + I_{2} - \frac{l_{1}}{h_{1 \xi}} K_{2 \xi} \right). \]

(107)

In this case, \( b_{2} \) is defined by \( b_{2} = - \frac{a_{2} b_{1 \xi} + a_{3} b_{1}}{3 a_{1} b_{1} + a_{2}} \), where \( b_{1} = - \frac{a_{2}}{2 a_{1}} \). The solution of (107) is then

\[ b_{3} = - e^{-\int_{\xi} \left( b_{2} + \frac{a_{3}}{a_{1}} \right) d \xi} \left[ \frac{1}{a_{1}} \left( \frac{l_{1}}{m_{1}} I_{3} + I_{2} - \frac{l_{1}}{h_{1 \xi}} K_{2 \xi} \right) e^{\int_{\xi} \left( b_{2} + \frac{a_{3}}{a_{1}} \right) d \xi} \right] d \xi. \]

(108)
Consider a special case of equation (103), which will generate \( K_1(y, z, 0) = 0 \) due to \( U(x_i, 0) = 0 \). The result of \( U = 0 \) will then be produced since \( V \) and \( W \) are zero. Following (91), we have that \( u_1 = u_2, v_1 = v_2 \) and \( w_1 = w_2 \), which show the uniqueness of velocities as in [9]. Meanwhile, since the relation, \( K_2(x, y, t) \neq \int I_2 dz \) of (102) is always hold, the result is consequently, \( P \neq 0 \), or \( p_1 \neq p_2 \) which imply the non uniqueness of pressure. This proves theorem 3.

5.2. Existence and Regularity Properties

Apart from uniqueness, the existence and regularity properties depend on the chosen function of the coordinate transformation, \( h_1(\xi) \), and the variable coefficients of Riccati equations, \( b_i \). Suppose that we take a velocity in \( z \) direction after the evaluation of initial-boundary conditions as

\[
w = \frac{b_9}{\varphi} e^{ih_1(\xi)} = C_{11} e^{ih_1(\xi)} \frac{1}{\varphi} \left( \int_\xi \varphi \Phi b_9 d\xi \right)^{\frac{1}{2}}.
\]

Then, the following statement is produced.

**Theorem 5.** Let \( K_1(y, z, t), K_2(x, y, t) \) and external forces are smooth functions, the following relations

\[
f_2 = \varphi e^{\int f_1 d\xi} e^{-\int f_2 d\xi} \text{ and } \Phi = \frac{1}{b_9} \left( \frac{2b_8\varepsilon C_5 - 2\varepsilon C_5}{\varepsilon^2 b_7 - 2C_5} \right)e^{\int \left( \frac{2b_8\varepsilon C_5 - 2\varepsilon C_5}{\varepsilon^2 b_7 - 2C_5} \right) d\xi}
\]

are satisfied such that there exist global solutions for \( u, v, w \) and \( p \) if \( b_7, b_8, b_9 \) and \( h_1(\xi) \) are bounded.

**Proof.** The solution becomes bounded if \( \varphi = \frac{2C_5}{\varepsilon} \int_\xi \phi b_9 d\xi \neq 0 \), which resulted to the following requirement

\[
(n - 1) \frac{3}{4} \left( \frac{\lambda_\xi + f}{\lambda} \right)^2 + \left( \frac{1}{2} \left( \frac{\lambda_\xi + f}{\lambda} \right) \lambda^{-n} e^{-n \int f d\xi} \right) \left( \frac{1}{2} \xi \left( \frac{\lambda_\xi + f}{\lambda} \right) \right) \lambda e^{n \int f d\xi} \xi < \infty,
\]

where \( \lambda = \frac{b_9}{\varepsilon} \) and \( f = \frac{\varphi}{\Phi} \). Therefore, by considering (65) and (110) it is clear that if \( b_7, b_8, b_9 \) and \( h_1(\xi) \) are bounded, the solution will then also bounded. Applying the result into (40) or (49), (4) and (2), the bounded solution for velocities in \( x \) and \( y \) directions including pressure are also produced. Also note that the solutions of \( u, v, w \) and \( p \) are twice differentiable if the external forces and arbitrary functions, \( K_1(y, z, t) \) and \( K_2(x, y, t) \) are smooth enough. Thus, theorem 5 is proved.
6. Conclusions

The method for producing the analytical solutions of the three-dimensional incompressible Navier-Stokes equations is introduced in this paper. The solution is constructed under the implementation of the higher polynomial differential equation such as in the following

\[ v_\xi = a_1 v^n + a_2 v^{n-1} + a_3 v^{n-2} + a_4 v^{n-3} + a_5 v^{n-4} + \cdots + a_{n-1} v + v + a_{n+1} \]  \tag{111}

which then reduce to the Riccati equation. The solution that is generated from the system of Riccati and polynomial equations is then expanded by the utilisation of proposed integral evaluation. The existence is proved and the uniqueness property is ensured for velocities, meanwhile the pressure is not unique.
